Product Description

347 321 Hot Rolled Stainless Steel Coil Thick 3mm For Structural Equipment

Stainless steel is divided into several categories and each category is further divided into grades and series. The steel grade defines what type of steel and its composition and properties. While the grades reflect the specific alloy's durability, quality, and temperature resistance, the numbers listed after the grade refer to its chemical composition, especially the chromium and nickel percentages. It plays an important role for fabricators, specialists, and customers to determine their requirement.

The most used grades of steel are the 200 series, 300 series, 400 series and duplex series. Moreover, 304, 304L, 316 and 316L stainless steel coils are the most popular and economical grades of stainless steels.
